## INTRODUCTION

When Timken introduced its revolutionary AP™ (All-Purpose) railroad bearings in 1954, it was a railroad industry milestone. Decades later, Timken is a leader in the friction management and power transmission industries and continues to lead in advancing bearing technology through continuous innovation and development.

In addition to railroad applications, AP bearings are successfully used in many types of industrial applications. This can be attributed to many factors including the bearing's high load carrying capacity and its adaptability to a wide variety of applications.

### ADVANTAGES OF TIMKEN AP BEARINGS

- Self-contained unit provides substantial cost savings in design and installation. Many mounting parts are available with the bearing assembly.
- Pregreased unit reduces installation costs.
- Preassembled bearing reduces the number of separate parts to be applied and helps reduce the chance of incorrect assembly.

- High quality, tested and improved radial lip seals provide exceptional protection, minimum relubrication and low maintenance.
- Positive alignment of rollers is maintained in the bearing due to its basic tapered roller construction. This distributes the load over the entire roller length and helps to prevent rollers from skewing.
- On-apex design provides true rolling motion with less friction and more resistance to wear.
- Case-hardened and hardened cones, cups and rollers put hardness where it is needed at the working surfaces. The core of these parts, being more ductile, resists the propagation of fatigue cracks and spalls.
- AP bearings are adaptable to a wide range of applications in new designs and changeovers from other bearing types. AP bearings range in bore size from 101.6 to 203.2 mm (4 to 8 inches). Optional auxiliary parts can be added to suit a wide range of mounting configurations.

### BEARING RECONDITIONING

Rail Bearing Service Corporation, a wholly owned subsidiary of Timken, reconditions bearings and related parts used in railroad rolling stock and industrial equipment. To learn more about repair for AP bearings, contact your Timken representative.

### TIMKEN® AP BEARING ASSEMBLY DESCRIPTION OF PARTS

A

- The narrow adapter shown in Fig. 1 can be used in many applications. Another type of mounting utilizes a full bore housing (see page 21). While this type of housing is currently unavailable through Timken, most bearing distributors provide a selection from other manufacturers.
  - The bearing assembly is pressed on the axle as a completely sealed unit. The axle end cap, cap screws and locking plate
- can be applied to the axle as a unit. When the axle end cap, as shown in Fig. 1 is used, the locking plate provided locks the cap screws.
- The recessed end cap, not shown, reduces the overall bearing assembly width. A piece of soft wire is required to lock the drilled cap screw heads. A backing spacer can be used in place of a backing ring.

**HOW TO IDENTIFY ASSEMBLY NUMBERS AND PART NUMBERS**

**BEARING ASSEMBLY NUMBERS**

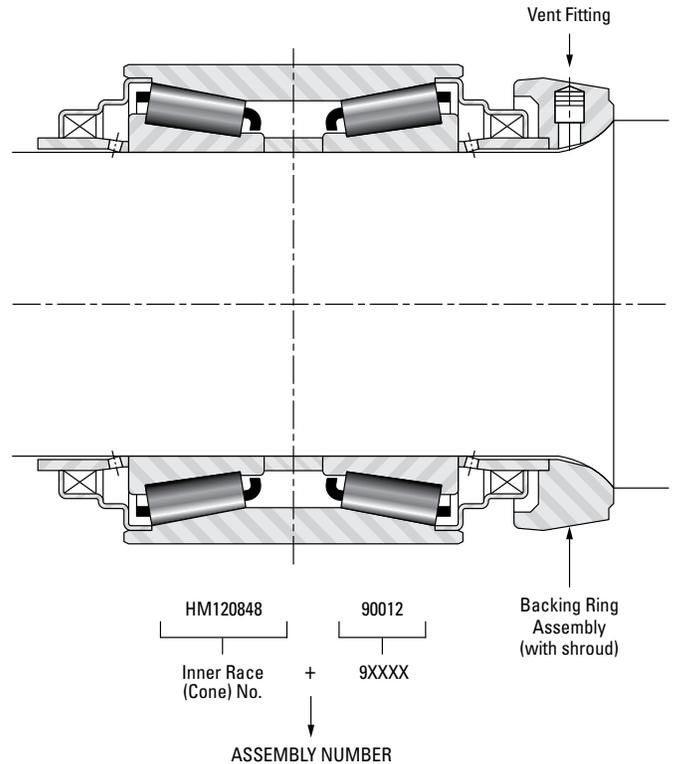

In order to facilitate the identity of groups of parts, a “bearing assembly number” system is used. AP bearings are each assigned a five digit numeric code that follows the cone part number to describe the individual component parts, prelubrication, performance codes, and internal clearance of the pre-set assembly. In some cases the code may be alphanumeric, although the first digit is always “9”.

For new applications, an assembly number is assigned on receipt of the first order. It is very important for the correct fitting and functioning of the bearing that the same assembly number is quoted for all subsequent replacement orders for that specific bearing position. Standard and supplemental assembly numbers are listed in this catalog starting on page 55.

Timken should be consulted if additional information is needed on any combination of parts or if questions arise about the correct assembly number for a specific application.

The assembly, HM120848 90012, shown in Fig. 2 identifies an assembly consisting of:

- 2 - HM120848 cones
- 1 - HM120817XD cup
- 1 - HM120848XA cone spacer (fitted for normal internal clearance)
- 2 - K86890 seal wear rings
- 2 - K86895 seal assemblies
- 1 - K86874-90010 backing ring assembly consisting of:
  - 1 - K86874 backing ring
  - 1 - K89716 vent fitting

**Fig. 2 Typical AP bearing assembly**

## CRANE BRIDGE AND TROLLEY AXLE

This illustrates a typical AP bearing mounting for crane bridge and trolley axle using recessed end cap. This clamped wheel design is shown on a drive axle. The idler axle design is similar except both bearings are clamped in the same manner as the left-hand assembly shown in Fig. 3.

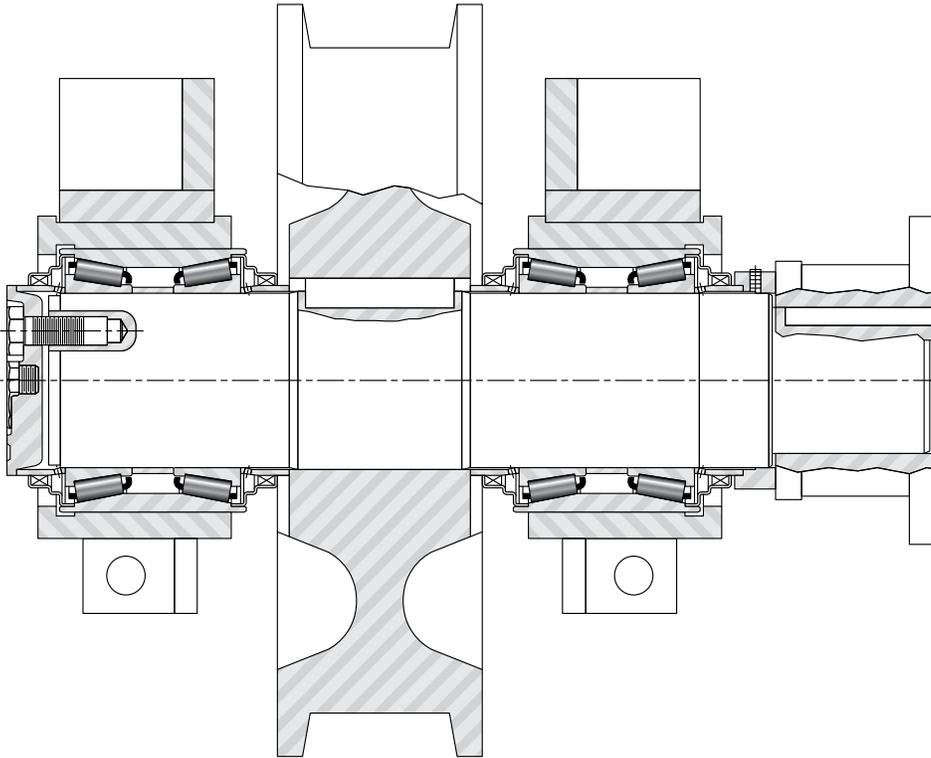

Fig. 3 Cross section of AP bearing on a drive axle

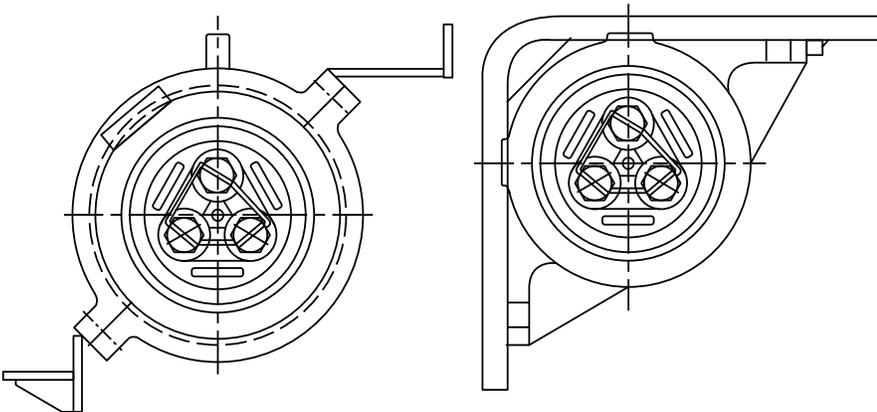

Fig. 4a

Fig. 4b

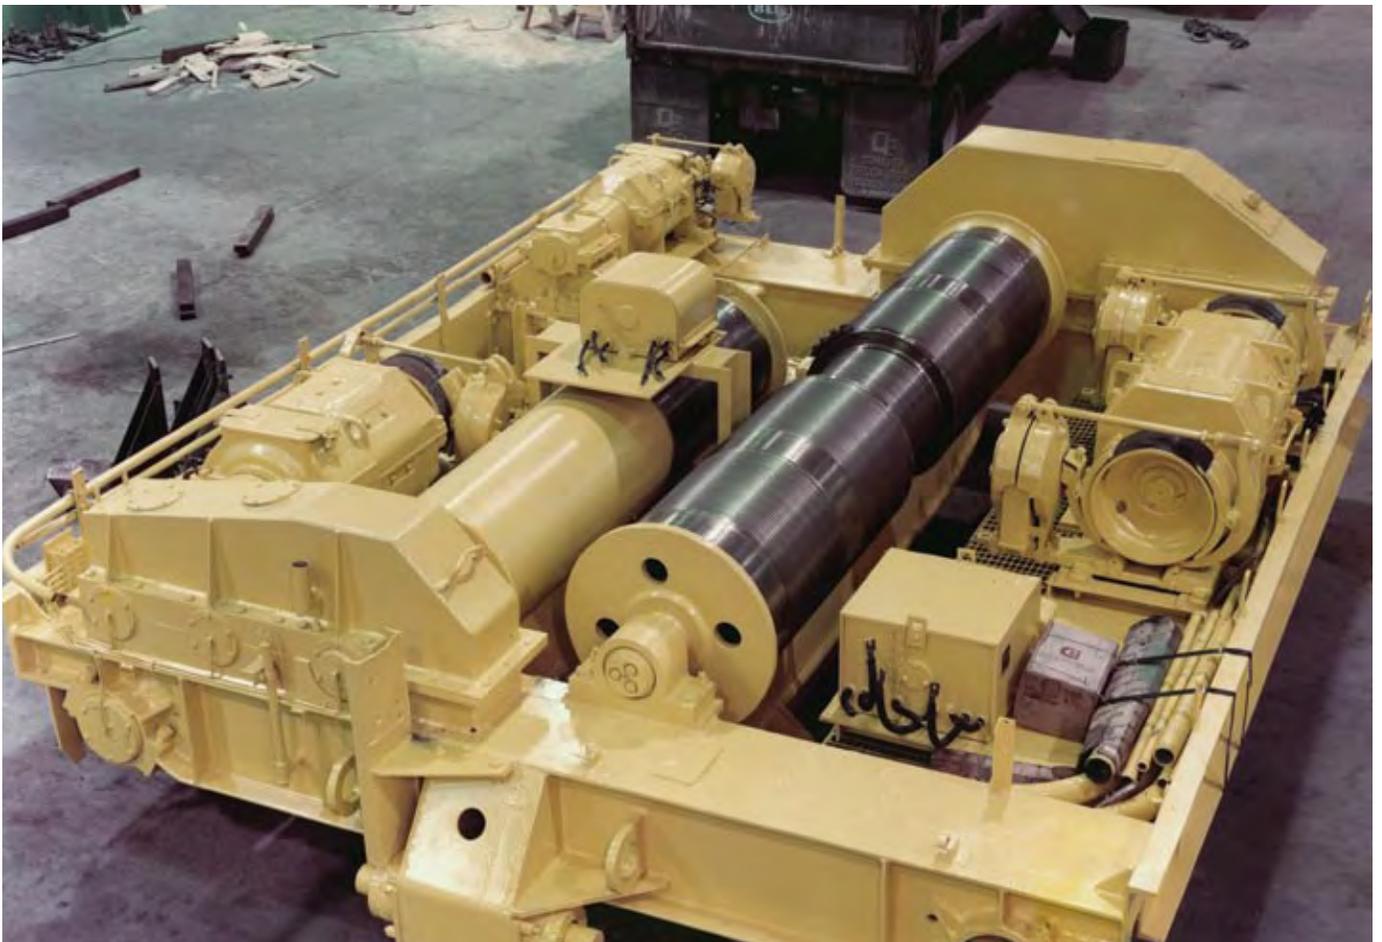

Typical full bore housing designs for crane wheel applications

**Crane Bridge and Trolley Axle**

The crane bridge and trolley axle photos below illustrate an example of a standard and recessed end cap.

**Fig. 5 Standard end cap design**

**Fig. 6 Trolley utilizing AP bearings with recessed end cap for wheel and drum drive**

### **Moveable Stadium Roof**

**Fig. 7** The Toronto Blue Jays Stadium uses Timken bearings in the moveable stadium roof

### **Narrow Adapter Mounting**

**Fig. 8** Narrow adapter mounting on trolley safety bar

TABLE ROLLS

Line Shaft Drive Full Bore Housing

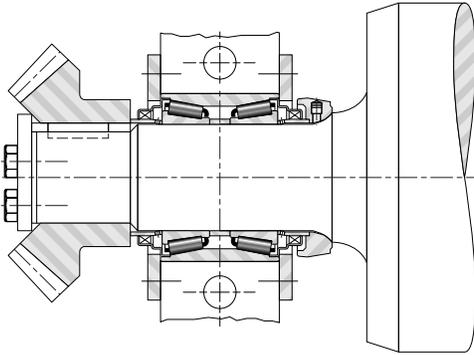

Fig. 9a Fixed side

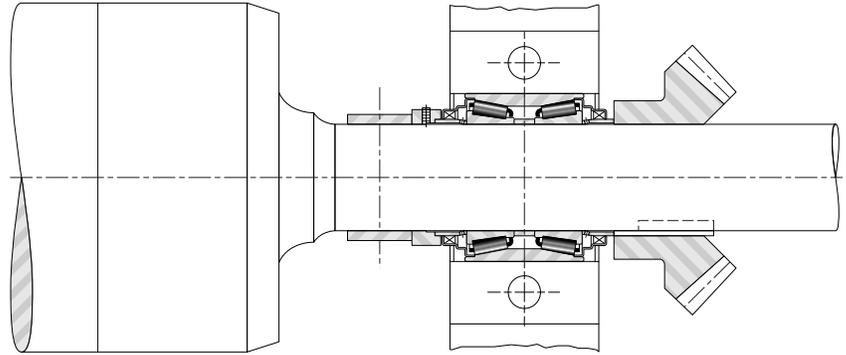

Fig. 9b Float side

Ram Roller - Adapter Mounting

Fig. 10 A standard narrow adapter is used at both positions to ensure positive radial location of the AP bearing cups. A close clearance is provided between thrust lugs and the sides of the adapters to keep axial movement of the roll to a minimum.

### CONTINUOUS CASTING MACHINE GUIDE ROLLERS AND RUNOUT TABLES

Used on both original and conversion guide roller applications, AP bearings provide a low maintenance, economical mounting arrangement.

Close tolerance adapters are used in the lower design. Caster AP bearings are available with or without a narrow adapter or solid housing.

Fig. 11 AP bearing equipped runout tables

### PILLOW BLOCK

Greasing systems may not be required with the prelubricated AP bearing used in certain pillow block applications. Contact your Timken service representative for more information.

Fig. 12 AP bearings used in pillow block application

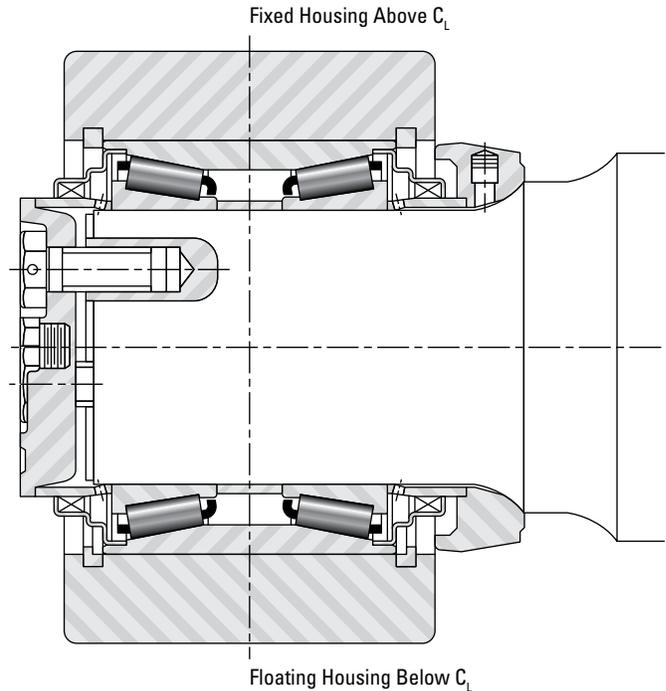

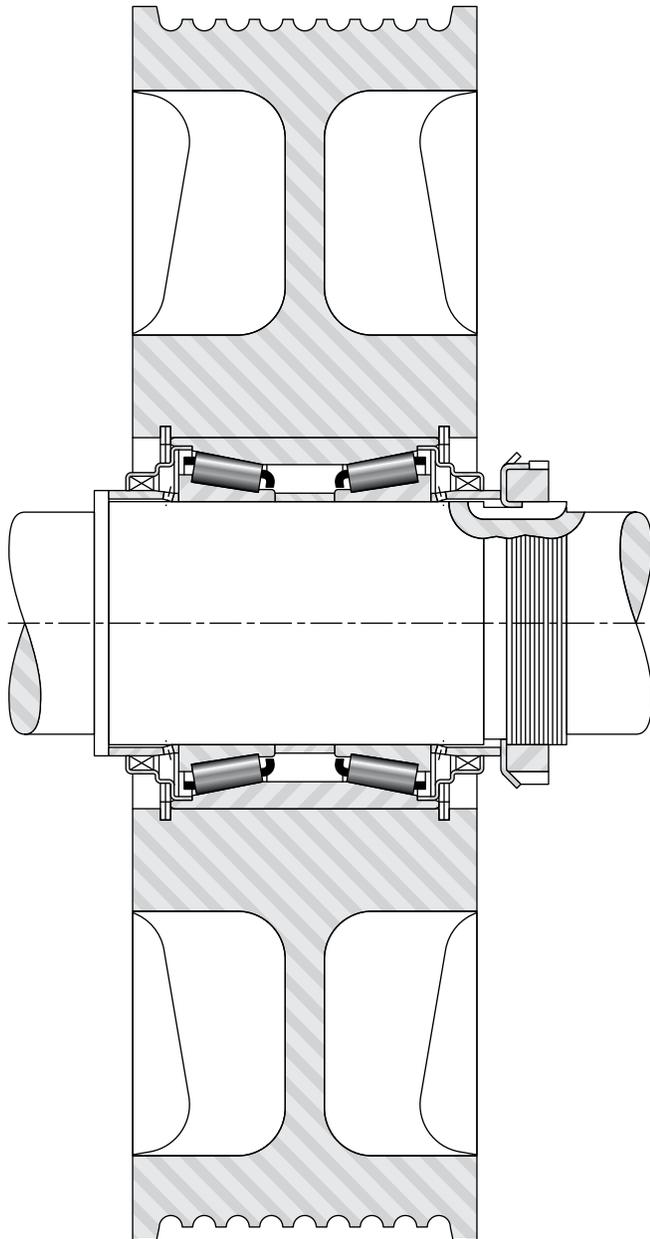

Fig. 13 Cross section of AP bearing in housing

**ELEVATOR SHEAVE**

The cup of this AP bearing is mounted directly into the sheave hub with a tight fit. Snap rings are required because of elevator safety regulations.

No provision for relubrication is made in this application. Some builders prefer to completely fill the bearing with grease at assembly while others depend on the initial charge of grease as supplied in a new bearing. Either practice is satisfactory for this specific application.

**Fig. 14 Section view of elevator sheave**

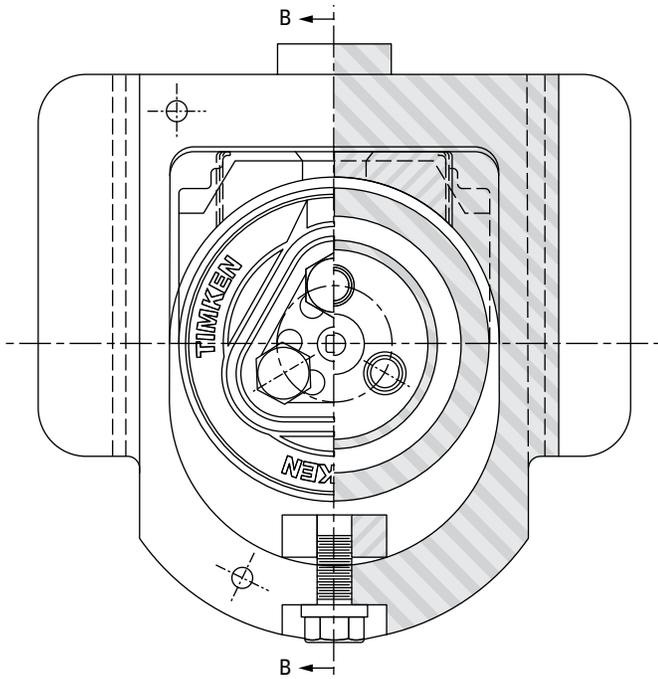

**Fig. 15 AP bearings shown on typical elevator sheave application**

C

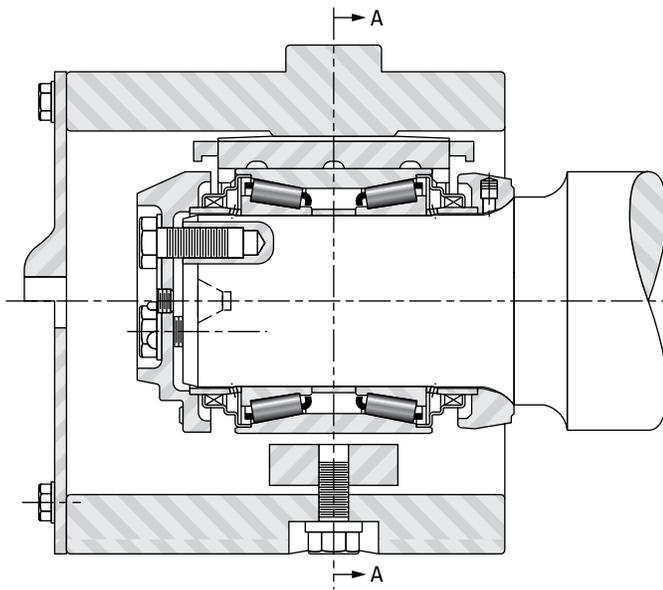

## INGOT CARS

Thousands of AP bearing-equipped ingot cars in various capacity ratings are in service in steel plants around the world.

Half Front View

Half Section A-A

Section B-B

Fig. 16 Cross section of AP bearing in ingot car

Fig. 17 Bottom pour ingot car equipped with Timken AP bearings

Fig. 18 Coil transfer car equipped with AP bearings on axles

### COIL TRANSFER CAR

The cones in this inboard design are clamped on the shaft by the press fit of the wheel hub.

The adapter is mounted in a cast side frame and is restricted from axial movement as shown in Section C-C of Fig. 19.

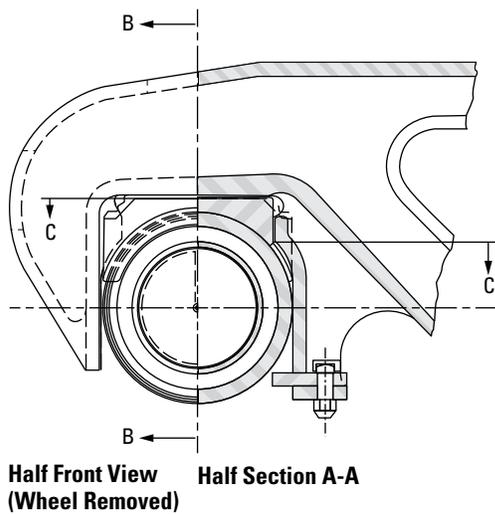

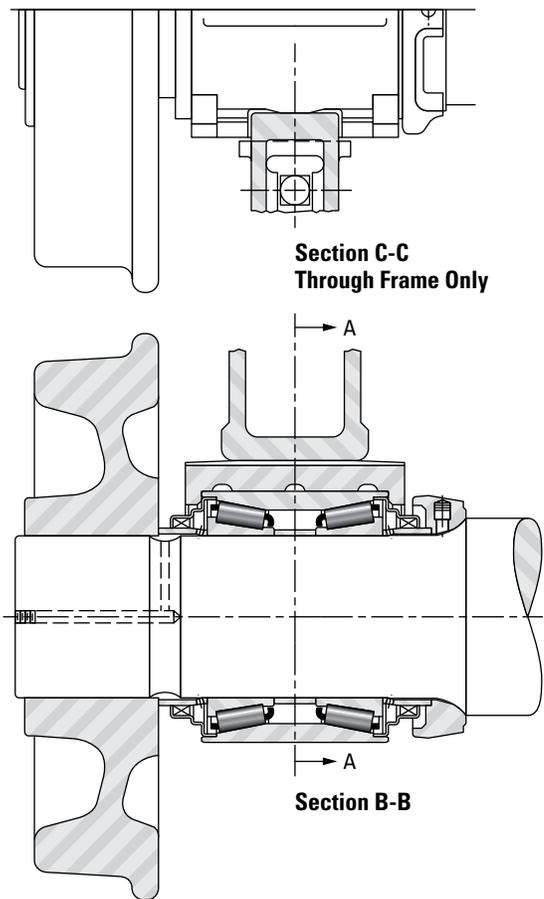

Fig. 19

### SINTERING CAR WHEEL

This application illustrates the effectiveness of the AP bearing seals in excluding the abrasive material from the bearing elements.

Fig. 20 Coke transfer car equipped with AP bearings

### COAL CRUSHER

AP bearings are used on the breaker shaft as well as in the conveyor drive head and tail drums of this coal crusher (Fig. 21a and Fig. 21b).

Fig. 21a Coal crusher shaft

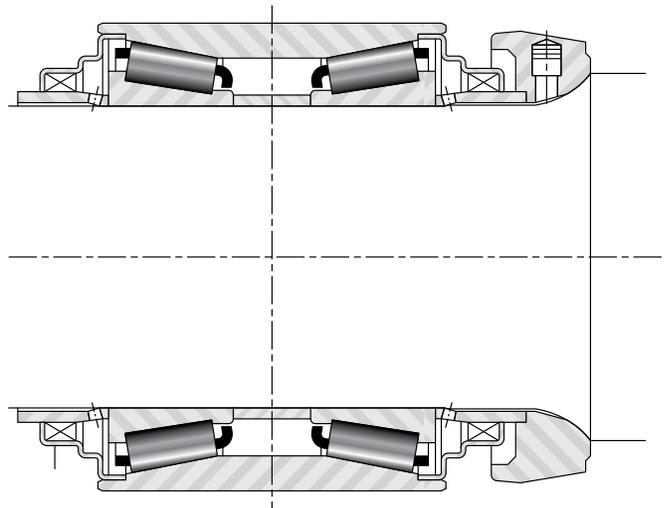

Fig. 21b Cross section of AP bearing in coal crusher

### WOOD PULP BEATER SPINDLE

This beater spindle uses all standard parts of the AP bearing unit with exception of the special housing (Fig. 22a and Fig. 22b). A clearance can be provided between the faces of the cup and housing shoulders to provide axial float as required. Note that this design uses a split housing.

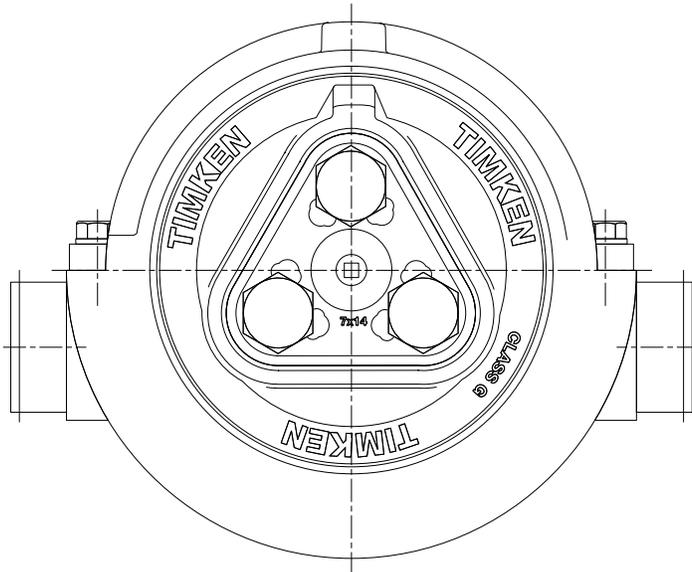

Fig. 22a Wood pulp beater spindle

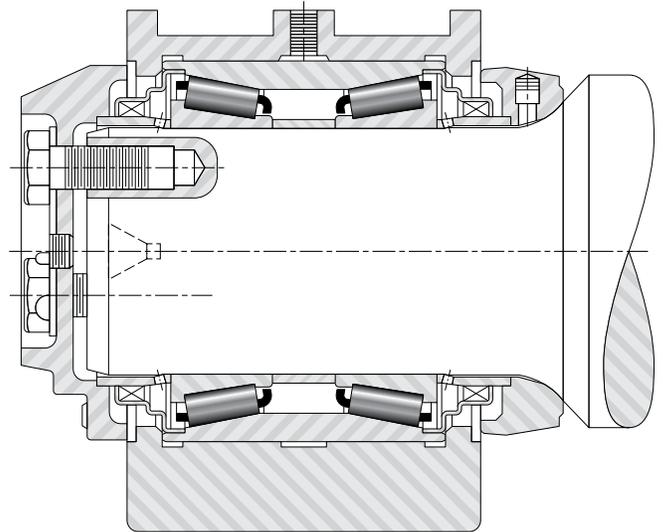

Fig. 22b Cross section of wood pulp beater spindle

### FURNACE WHEEL

This design takes advantage of the “package” portion of the AP bearing–seal wear ring to seal wear ring. The use of both the adapter and backing ring is eliminated. The end cap is applied after insertion of a special spacer backing against the seal wear ring to clamp up the bearing assembly (Fig. 23).

<sup>(1)</sup> See page 38 for fitting practice information.

<sup>(2)</sup> Bearing width dimensions.

<sup>(3)</sup> Outer undercut can be eliminated if housing is shortened to end of the “Cg” dimension.

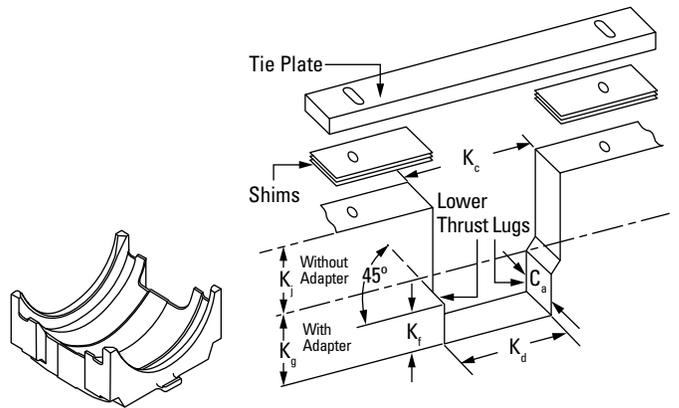

<sup>(4)</sup> Relief machined on cup O.D.; housing undercut not required.

NOTE: Full bore housings are not furnished by Timken.

**ADAPTERS AND MOUNTING DESIGNS**

**Mounting Dimensions for Narrow Adapter**

1. Thrust lugs could be welded or machined into opening.
2. Class G and K adapter do not require thrust lugs.
3. Provide shim to give 0.25 mm to 0.38 mm (.010 in. to .015 in.) clearance between tie plate and cup O.D. If cup turning in the adapter should occur a resilient pad may be used between the tie plate and the cup O.D. to lightly hold the cup from turning.

### Press Fit Force Required to Apply Collars, Gears, or Couplings Used to Retain an AP Bearing

The clamping force resulting from a press fit is equal to:

$$F = 1/2 \pi f L \delta E [1-(b/c)^2]$$

Where:

F = Clamping Force - newton (lb)

f = Coefficient of Friction = .17

L = Length of Clamping Part - meter (in.)

δ = Fit on Dia - meter (in.)

E = 2.068x10<sup>11</sup> pascal (30x10<sup>6</sup> lb/in<sup>2</sup>)

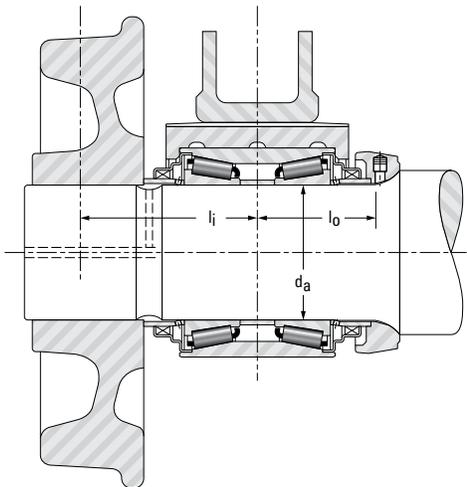

b = I.D. of Clamping Part - mm (in.)

c = O.D. of Clamping Part - mm (in.)

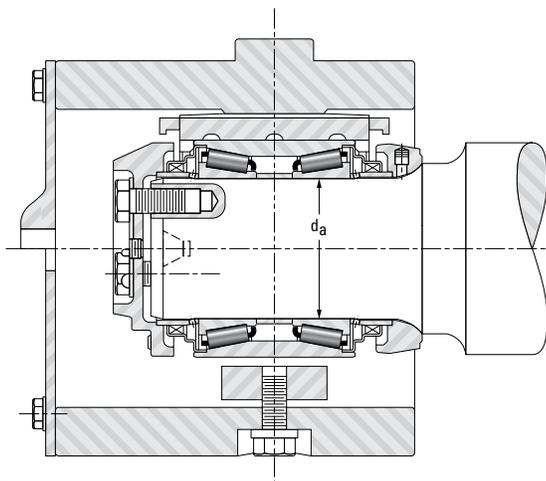

Class	Force Min.
	Kilonewtons Tons
B & C	267-35 30-40
D, E, & F	445-534 50-60
G & GG	534-623 60-70
K	445 50

Table 1

### Shaft Stress Calculation for Cars and Rolling Stock

Inboard Journal

Outboard Journal

$$S = \frac{10.2 \times P \times l}{(d_a)^3}$$

Where:

S = Axle Stress - MPa (lb/in<sup>2</sup>)

P = Bearing Load - newton (lb)

da = Cone Seat - mm (in.)

li and lo = Moment Arm - mm (in.)

Inboard Journal - li = Distance from bearing centerline to wheel load centerline

Outboard Journal - lo = Distance from bearing centerline to point on da tangent to shaft radius

Table 2

## BEARING LIFE EQUATIONS

$$L_{10} = \left( \frac{C_{90}}{P} \right)^{\frac{10}{3}} \left( \frac{1.5 \times 10^6}{n} \right)$$

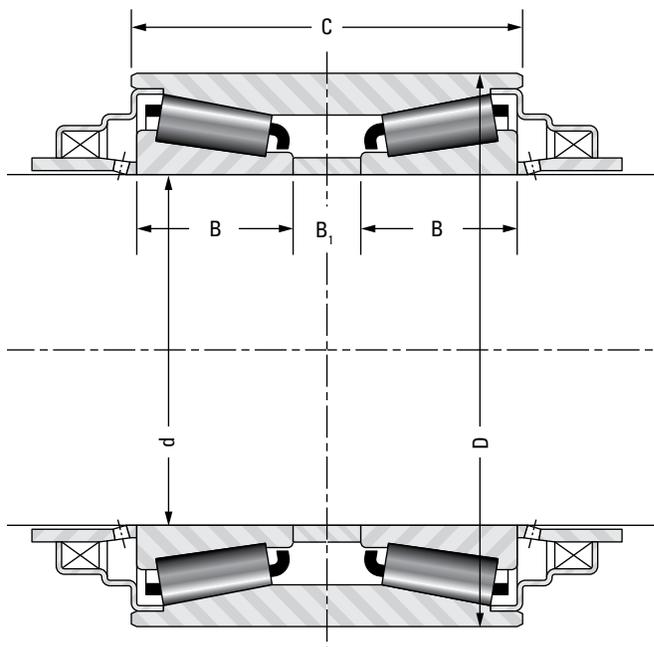

Where:

$L_{10}$  = Rated life in hours (life expectancy associated with 90% reliability)

$C_{90}$  = Basic dynamic radial load rating at 500 RPM for 3000 hr  $L_{10}$

$P$  = Dynamic equivalent radial load from a combination of radial and thrust loads

$n$  = Rotational speed in RPM

D

<sup>(1)</sup> K Factor is defined as the tapered roller bearing radial to axial dynamic capacity ratio.

## ASSEMBLY AND DISASSEMBLY

### Bearing Installation

Bearing assemblies should be stored in a clean dry place, protected from moisture, and kept dry until they are installed on the shaft.

Bearing assemblies should not be removed from the shipping package nor should the protective wrapping be removed until they are installed.

Do not remove the cardboard insert from the bore of the bearing assembly. This insert will hold the cone spacer in alignment with the bearing cones when installing the bearing assembly on the pilot sleeve.

### Pressing Bearing Assemblies on Shafts

The amount of press fit of the bearing on the shaft is predetermined by the dimensional tolerances of the shaft and bearing cones.

Tools designed for roller bearing installation and removal should be used.

Timken AP bearings may be installed or removed with a bearing press, wheel press, or with portable fixtures depending on production requirements.

Coat the bearing seats of the axle with castor oil, heavy mineral oil, or a molybdenumdisulphide and oil mixture. (Do not use white lead.) Lead compounds may be detrimental to lubricating greases by acting as an oxidation catalyst.

A thin coating of rust preventive can be applied to the axle fillet if the standard backing ring (Fig. 26) is used. The rust preventive used must not contain lead or other compounds which may be detrimental to lubricating greases.

The bearing assemblies are shipped with a protective coating of grease over the vent fitting. Care should be taken to see that the grease is not wiped off when the bearings are applied to the axles.

*NOTE: Heat must not be applied to the bearing cone assemblies to facilitate installation.*

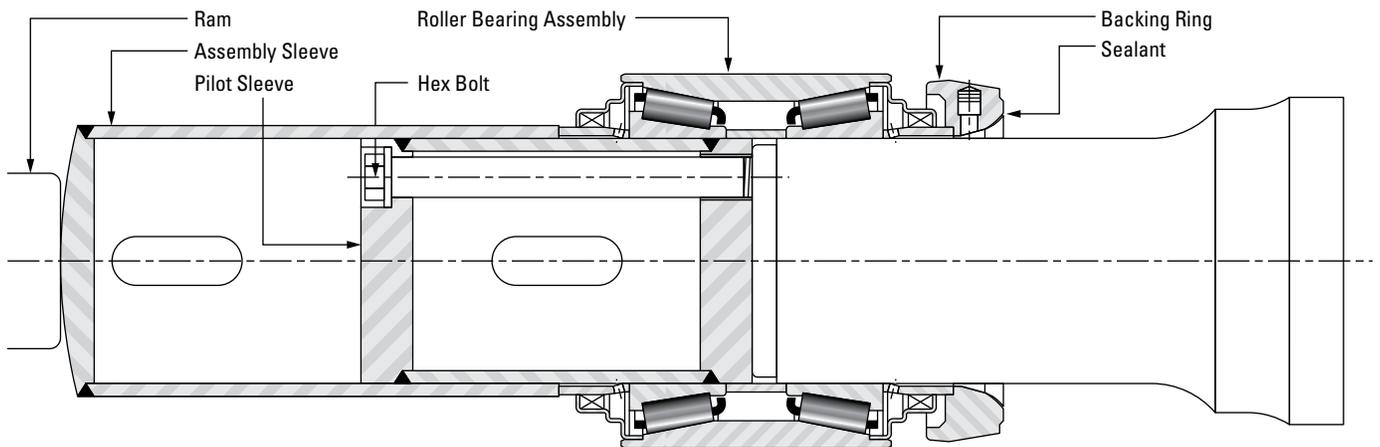

Fig. 26 Separate sleeve method of applying roller bearings to a shaft

A pilot sleeve should be used to keep the cone spacer in alignment with the bores of the cones and to guide the bearing assembly on the axle (page 45).

An assembly sleeve which contacts the seal wear ring outer face and telescopes over the pilot sleeve is used to press the bearing on the axle.

When the bearing assembly is slipped on the pilot sleeve and the cardboard insert is ejected, the seal wear ring should be held in place to prevent it from sliding out of the enclosure seal.

If the seal wear ring slips out of the assembly it must be inserted into the enclosure seal correctly and carefully, chamfered end first, so that the outer lip of the seal does not turn under when the seal lips are expanded over the seal wear ring.

*NOTE: Do not insert any tool or other instrument between the seal element lips and seal wear ring. This may damage the seal element lips or scratch the seal wear ring resulting in bearing lubricant leakage.*

To make sure that the bearings are firmly seated against the axle fillet, the forces shown (Table 3) should be applied to the bearings after the surge of the pressure gage indicates that the bearings have contacted the axle fillet.

Due to the rubbing type seals, the bearing assembly will not rotate freely at initial application. New bearing assemblies are pre-set at the factory. No adjustment is necessary at installation.

Class	Clamping Force
	Kilonewtons Tons
B & C	<b>267-356</b> 30-40
D, E, & F	<b>445-534</b> 50-60
G & GG	<b>534-623</b> 60-70
K	<b>445</b> 50

**Table 3 Bearing installation force**

## Applying The Axle End Cap

Remove the axle end cap assembly from the carton and remove the cardboard cap screw retainer.

Apply the axle end cap, locking plate, and cap screws to the end of the axle as a unit.

A ratchet wrench or an impact wrench may be used to run up the cap screws.

Tighten the cap screws with a torque wrench to the torque specified in (Table 4). Re-check each cap screw several times until the specified torque is obtained for each cap screw.

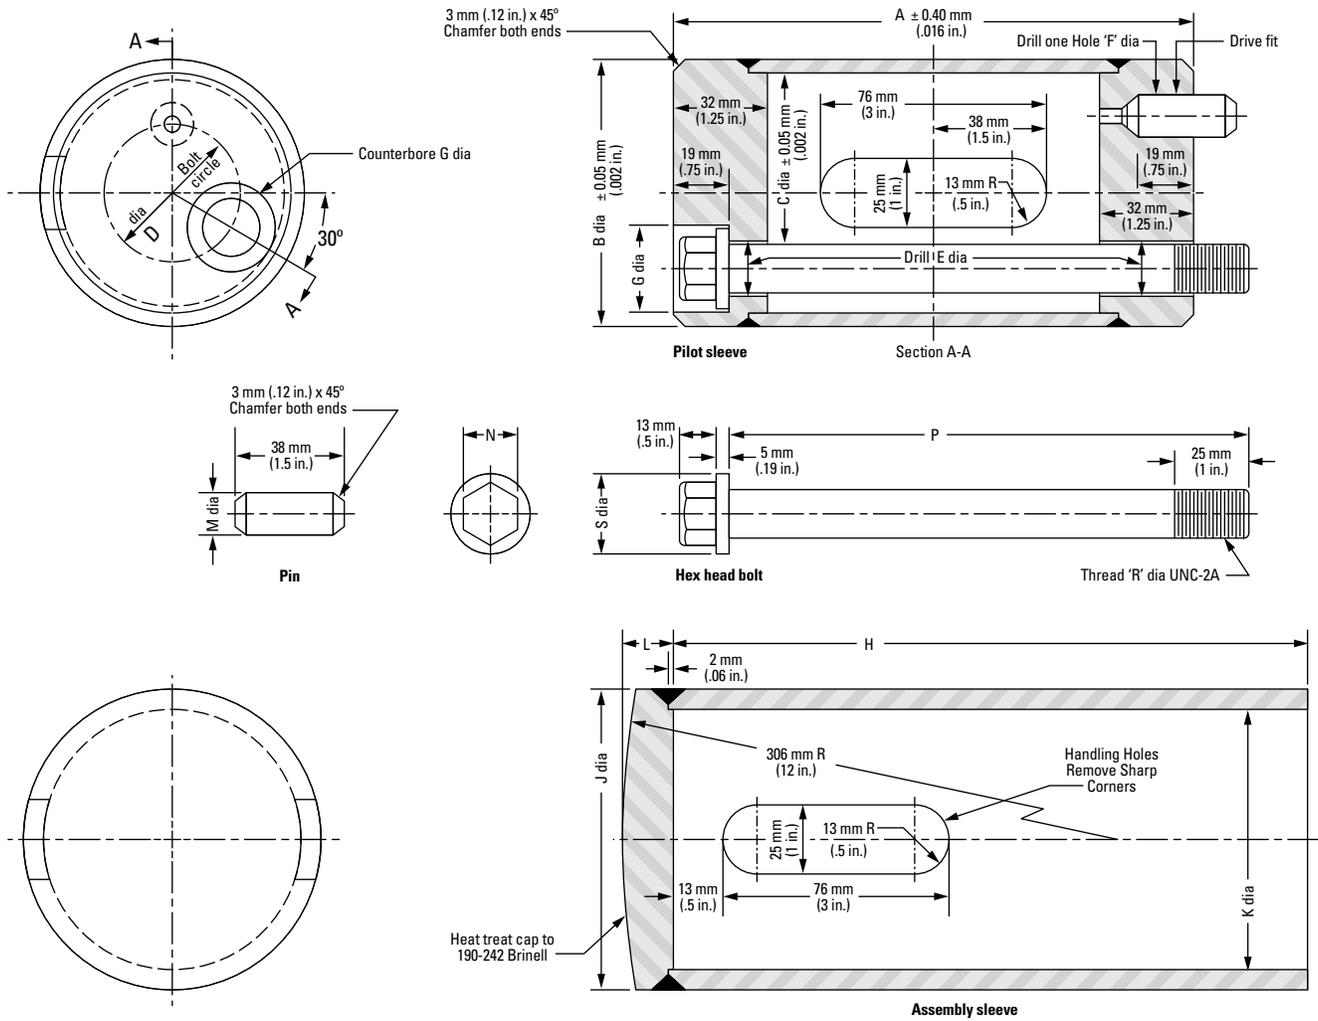

Cap Screw Size	Torque
	N-m lb-ft
½ in.	<b>149-163</b> 110-120
¾ in.	<b>149-163</b> 110-120
⅞ in.	<b>190-203</b> 140-150
1 in.	<b>339-366</b> 250-270
1 ¼ in.	<b>488-529</b> 360-390
1 ½ in.	<b>583-624</b> 430-460

**Table 4 Cap screw tightening torque**

Lock the cap screws by bending all tabs of the locking plate flat against the sides of the cap screw heads. For the recessed end cap, simply wire the heads together.

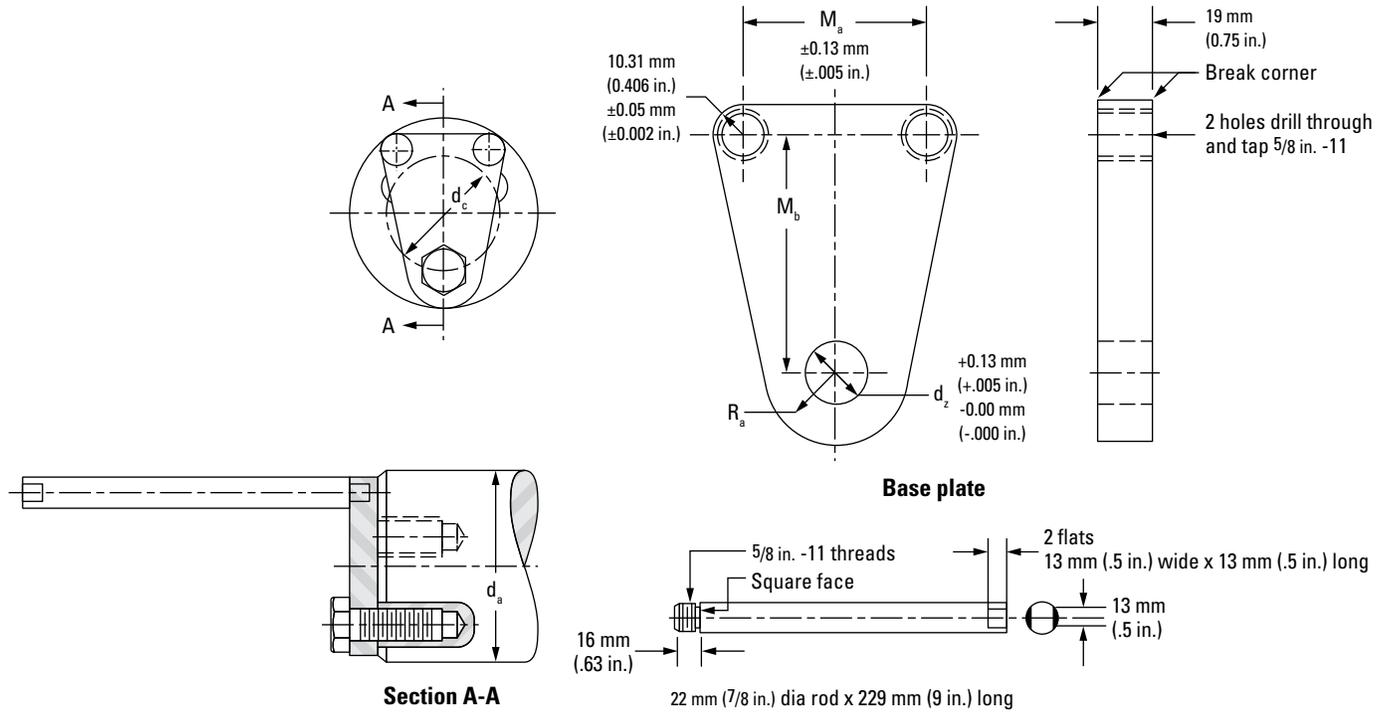

If water or humid conditions exist, a bead of sealant can be applied around the joint of the backing ring and shaft, after the bearing assembly is pressed in place (not required for backing rings press fitted on shaft step).

NOTE: For those applications where a limited quantity of bearings are to be mounted, the assembly tool shown above can be economically fabricated.

## SIMPLIFIED INSTALLATION OF AP BEARINGS FOR INDUSTRIAL EQUIPMENT

### Installation Methods

What does the operator of a machine do when the operator's machine, located in a remote area away from any sophisticated tools, needs a bearing replaced? Timken suggests using the following procedures for installing AP bearings when sophisticated tools are not available. These methods for installing AP bearings are valuable ways of saving time and money.

Unlike other tapered roller bearing installations where the individual components are installed separately, the complete AP bearing assembly should be installed at the same time.

### Hydraulic RAM Method

One method of installation utilizes a pressure piston pump and ram in an arrangement as shown at right.

The 445 kilonewton (50 ton) capacity centerhole hydraulic ram is used for the Class D (5 ½ x 10) bearing.

### Threaded Rod and Nut Method

One of the least expensive tooling arrangements for installing our AP bearing utilizes the tools shown in Fig. 27.

The push tube is counterbored to accommodate our T127 thrust bearing to eliminate much of the friction between the nut face and the push tube.

Bearing Pilot

Impact Wrench

Fig. 27 Auxiliary equipment

**WARNING:**

*Failure to observe the following warnings could create a risk of serious bodily harm.*

Always use suitable personal protective equipment, including safety glasses.

### Tooling

Both installation methods used a 1 ¼ in.-7 UNC threaded rod (SAE 4340 steel, hardened 48-53 Rc) threaded into a bearing pilot. Both methods use a push tube, nut, and cap screws. An example of tooling is shown in Fig. 28.

Three cap screws are then used to bolt the bearing pilot to the end of the shaft.

Lubricant is applied to the shaft before pressing on the bearing.

Required installation clamping force for each size of AP bearing may be obtained from page 42.

### Comparison of Methods

If the user does not own a hydraulic pump and ram, the “threaded rod and nut” method may be less expensive. However, the

threaded rod and nut method requires slightly more time and effort to install the bearing.

Regardless of the method used for installing the bearing assembly, it should be made certain that all components are properly seated. A distinctive metallic ping occurs at the instant all the components are seated.

#### **WARNING:**

***Failure to observe the following warnings could create a risk of serious bodily harm.***

Proper maintenance and handling practices are critical.

Always follow installation instructions and maintain proper lubrication.

Fig. 28 Tooling used to push bearing onto shaft

**Bearing Removal (Axle)**

The bearing assemblies may be removed with a press or with portable fixtures. A force of 356-534 kilonewtons (40 to 60 tons) is normally required to break the bearing fit.

When it is desirable to remove the bearing without removing a wheel or other adjacent backing part, a pulling shoe is used, similar to that shown in Fig. 29.

Make sure that the pulling shoe is of the correct size for the bearing to be removed. Proper contact with the backing ring and puller alignment are necessary for efficient bearing removal.

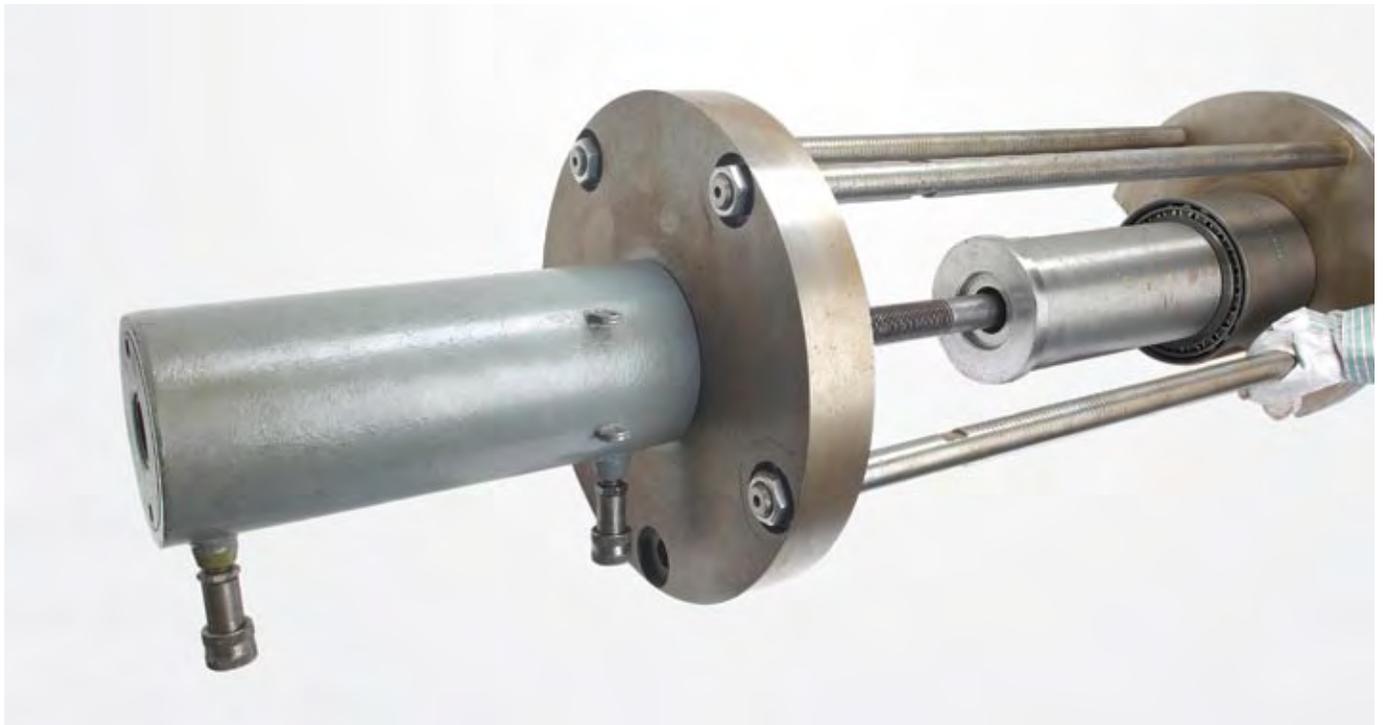

Position the pulling shoe behind the backing ring. The pulling shoe contact surface of the backing ring is very narrow. Therefore, it is necessary to hold the pulling shoe down in position behind the backing ring as shown below until the initial pressure has been applied to ensure proper contact with the backing ring. Extend the ram to remove the bearing from the axle.

If bearings are to be removed along with wheels, make sure that the wheel hub will contact the backing ring or seal wear ring if a backing ring is not used. If the axle has large wheel seats, a suitable shoe or blocks must be used to make contact between the wheel hub and backing ring.

When bearings are removed from the axle, a pilot sleeve or guide tube should be fastened to the end of the axle or to the press ram to keep the bearing parts together and protect them from damage. Do not drop the bearing when removing it from the pilot sleeve.

After the bearing assembly is removed from the pilot sleeve, a tube similar to the cardboard insert or a similar device should be inserted in the bore of the bearing assembly to hold the internal bearing parts in place. Particular attention should be given to keeping the seal wear ring in place in the enclosure seals.

When bearing assemblies are removed from the axles, the bearings should be disassembled, cleaned and inspected.

**Fig. 29 Holding the pulling shoe down against the bearing face bearing puller**

## Lubrication of AP Bearings

Timken AP bearings are furnished prelubricated approximately half full with greases approved by the Association of American Railroads (AAR) Specification M942-78.

To help prevent the ingress of contamination, it is advantageous for the customer to fill the AP bearing completely full of grease, particularly in low and moderate speed applications. The grease used to fill the bearing must be compatible with the factory fill grease. That is, any grease added to the factory grease must not result in grease softening and consequent leakage around the seals. A lithium 12 hydroxy stearate soap grease with added rust and oxidation inhibitors is suggested. The viscosity of the base oil should be in a range from 150-220 cSt at 40°C (60-100 SUS at 210°F). An NLGI No. 2 grease is preferred; however, if there is a problem of pumping an NLGI No. 2 grease in cold weather, an NLGI No. 1 grease can be used.

In industrial applications, factory fill greases are generally satisfactory up to 93°C (200°F) on a continuous basis and up to 121 °C

(250°F) on an intermittent operation basis. For higher temperature operating environments and grease temperatures up to 177°C (350°F), a high temperature grease should be used to fill the AP bearing, as well as for further relubrication. In these instances, products utilizing a urea, or complex, thickener should be used. The grease selected must also have rust and oxidation inhibitors and a minimum base oil viscosity of 150 cSt at 40°C (60 SUS at 210°F). Frequent relubrication may be required even with higher temperature capability greases.

 **WARNING:**  
*Failure to observe the following warnings could create a risk of serious bodily harm.*

Proper maintenance and handling practices are critical.  
Always follow installation instructions and maintain proper lubrication.

## HOW TO ORDER

### **E** HOW TO ORDER

<b>AP™ Bearing Ordering Procedure .....</b>	<b>51</b>
<b>Basic AP Bearing Assembly Numbers - Method 1.....</b>	<b>53</b>
<b>Supplemental and Special Assembly Numbers - Method 2 .....</b>	<b>55</b>

HOW TO ORDER

E

E

HOW TO ORDER

**AP BEARING ORDERING PROCEDURE**

Bearing assemblies may be ordered by two different methods.

**Method 1**

Purchase one of the two basic bearing mounting arrangements shown on page 53, plus the required auxiliary parts shown on page 54.

**Method 2**

Purchase an entire assembly or kit using the overall bearing assembly number as shown in the “Supplemental and Special Assembly Number” lists on pages 55 to 81. This overall assembly number includes all needed auxiliary parts.

Adapters are not part of the bearing assembly and should be ordered separately giving:

Quantity - bearing class - part number (page 55).

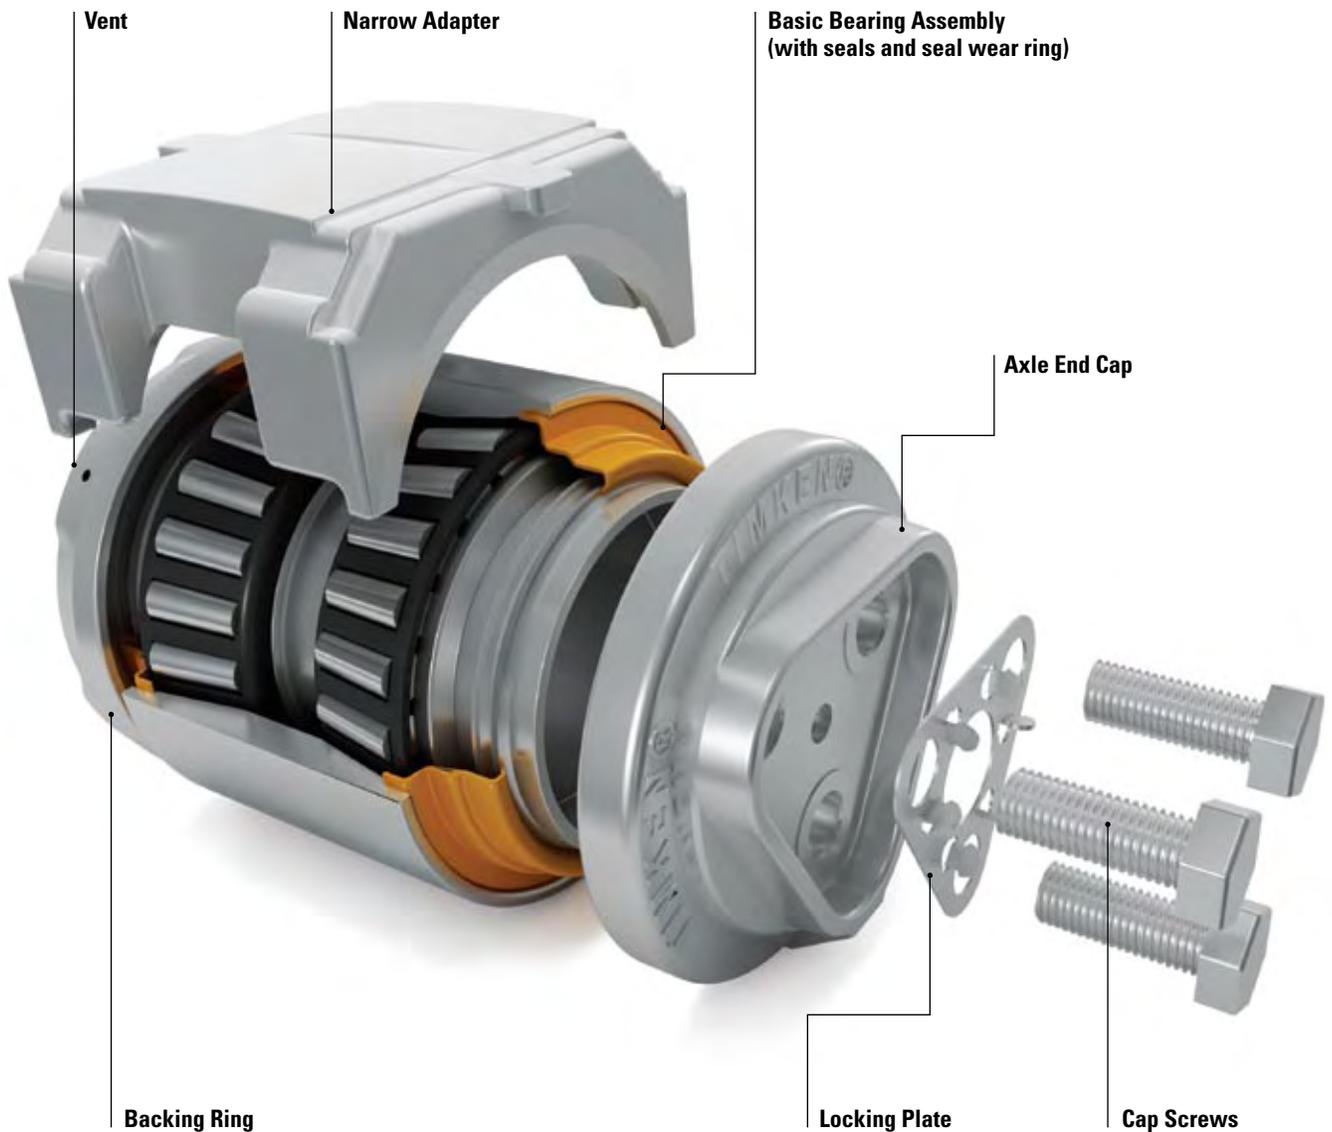

Fig. 30 3D illustration of AP bearing

## Basic AP Bearing Ordering Procedure

To facilitate order entry, identify the bearing assembly and required auxiliary parts by specifying the following details from the tables shown on pages 53 and 54. Also specify the quantity of each sub-assembly required to make up the assembly to suit your application. See page 13 for a detailed explanation of assembly numbers.

### An AP bearing assembly consists of:

- Basic AP assembly, does not include end cap (page 53)
- End cap – one per bearing (page 54)
- Backing spacer – one per bearing (page 54) with (choose one per bearing):
  - pipe plug
  - or lubricant fitting
  - or vent fitting

### EXAMPLES

#### 1. A Class D assembly with shroud and pressed backing ring includes the following part numbers to order:

- HM127446 90012 AP bearing assembly with shroud (page 53)
- K85521 90011 axle end cap assembly - one per bearing (page 54)

#### 2. A Class D assembly with auxiliary parts includes the following part numbers to order:

- HM127446 90048 basic AP bearing assembly (page 53)
- K85521 90011 axle end cap assembly - one per bearing (page 54)
- K120178 backing spacer - one per bearing (page 54)
- K83093 vent fitting - one per bearing (page 54)

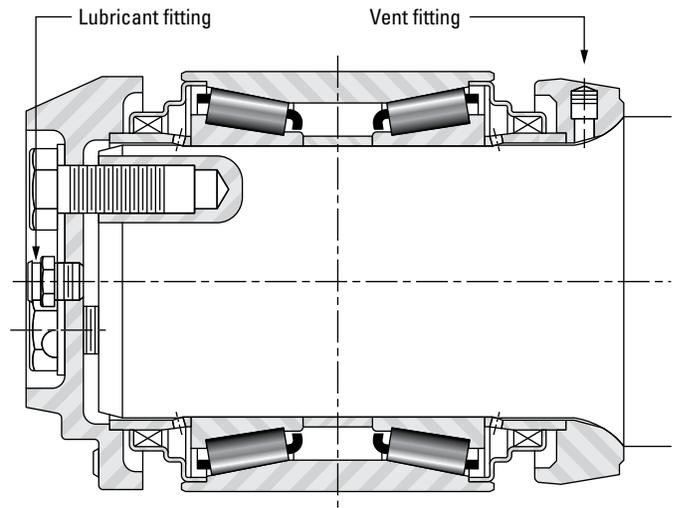

Fig. 31 Cross section view of AP bearing with shroud

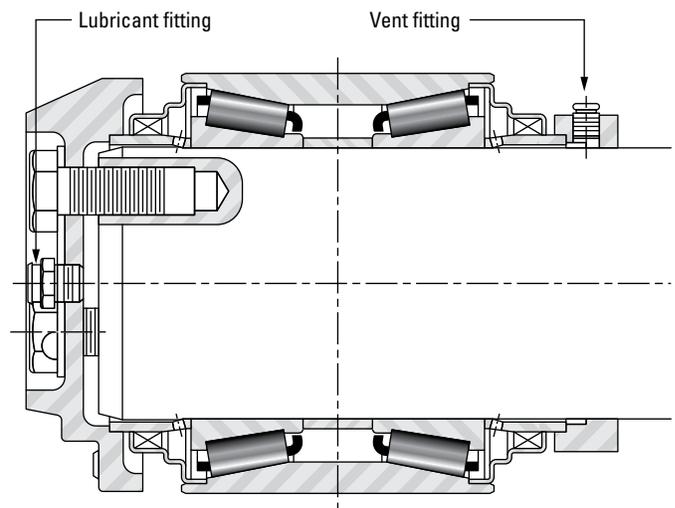

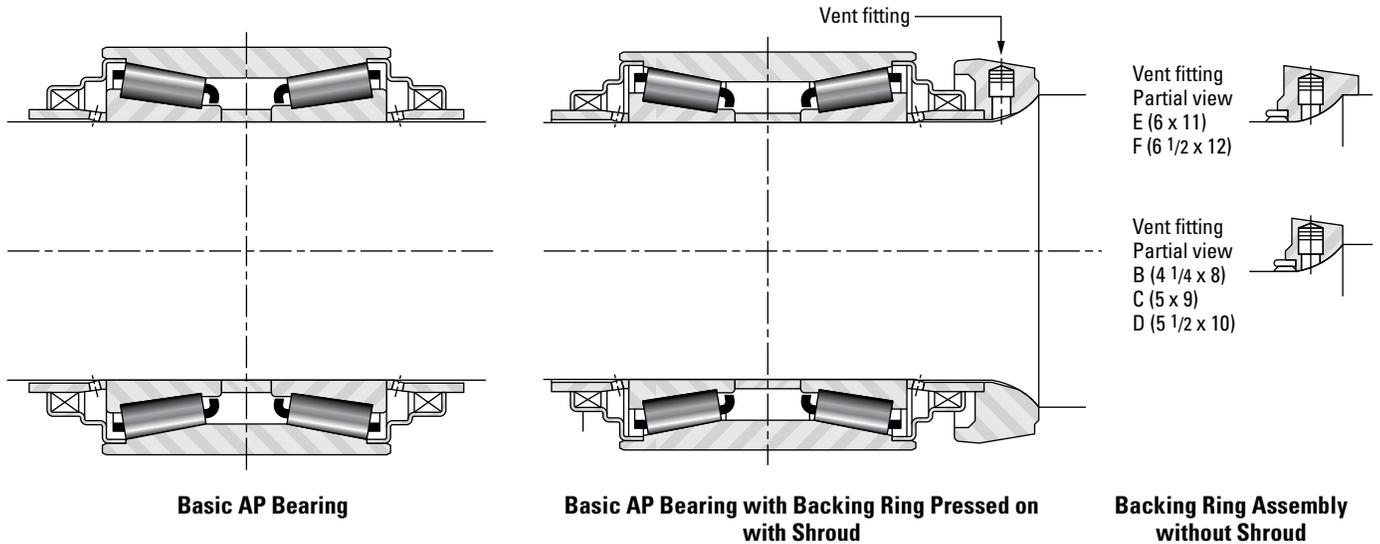

Fig. 32 Cross section view of AP bearing

METHOD 1

Basic Bearing Assembly Numbers

NOTE: Specify backing ring with or without shroud. Backing rings without shroud have reduced O.D. to facilitate assembly in some housing designs. Backing rings with shroud provide added seal protection where required.

AP Bearing Assembly Section

Determine basic AP bearing assembly required and specify from the following table (include CONE NUMBER as shown with bearing Class):

Example: If a Class D bearing with a backing ring with shroud is required, specify: AP bearing Class D HM127446-90012.

Class - Cone Number	Basic AP Bearing Assembly Number	Basic AP Bearing with Backing Ring Pressed on (Assembly Number)	
		Backing Ring With Shroud	Backing Ring Without Shroud
B (4 1/4 x 8) HM120848	90014	90012	90124
C (5 x 9) HM124646	90056	90014	-
D (5 1/2 x 10) HM127446	90048	90012	90318

NOTE: Cup O.D. tolerances of 0.025 mm (.0010 in.), reduced width assemblies, assemblies with provision for relubrication through the center of the cup, and assemblies without seal parts are available in some bearing classes. Consult your Timken representative for availability.

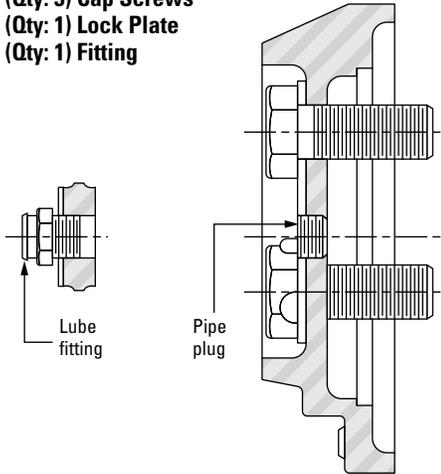

## METHOD 1

### Auxiliary Parts

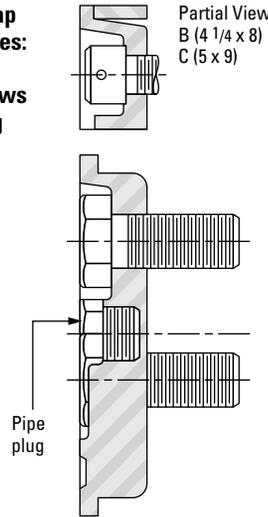

Auxiliary parts may be added to basic AP bearings, as required.

NOTE: Provide for relubrication on one side of bearing with vent at opposite side. If an auxiliary part is not used, these provisions should be made in parts adjacent to the bearing.

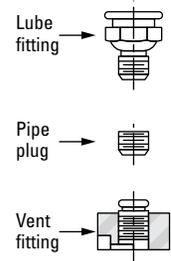

**Axle End Cap Assembly Includes:**  
**(Qty: 1) End Cap**  
**(Qty: 3) Cap Screws**  
**(Qty: 1) Lock Plate**  
**(Qty: 1) Fitting**

**Recessed End Cap Assembly Includes:**  
**(Qty: 1) End Cap**  
**(Qty: 3) Cap Screws**  
**(Qty: 1) Pipe Plug**

**Backing Spacer (with fitting choices)**

**METHOD 2**

**SUPPLEMENTAL AND SPECIAL ASSEMBLY NUMBERS**

**Typical AP Bearing Mounting Arrangements**

The following illustrations on pages 58 to 81 show typical combinations of basic AP bearings and auxiliary parts. See page 13 for a detailed explanation of assembly numbers. When these overall assemblies are used with the narrow adapter shown in Fig. 33, bearing mounting kits are formed.

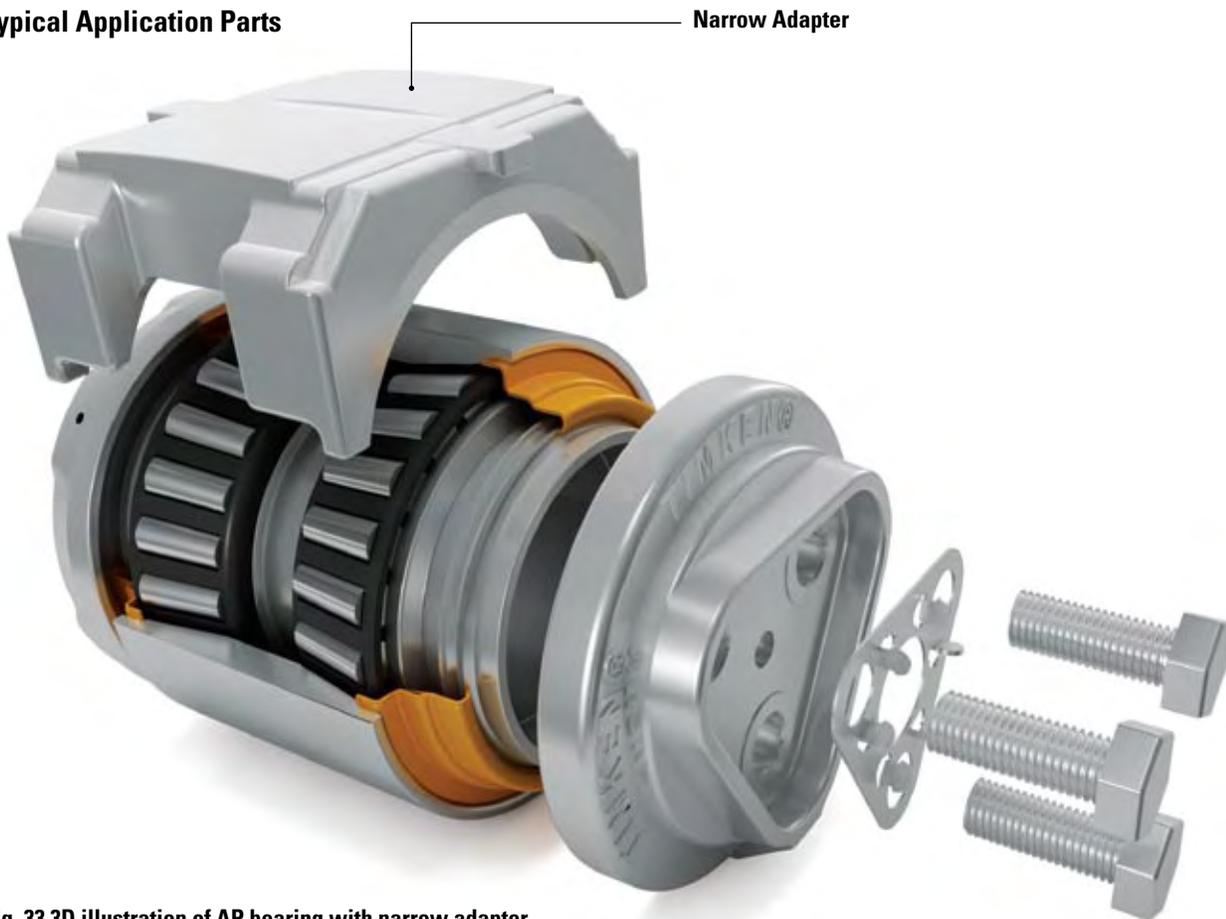

When making up a mounting arrangement, a provision for relubrication should be made on one side of the bearing, with a vent on the opposite side. If an auxiliary part is not used, these provisions should be made in the parts adjacent the bearing.

Also, when designing an AP bearing into an application, the bearing must always be securely clamped through the cones. Depending on the mounting arrangement used, this may require additional parts, such as spacers, which are not furnished by Timken.

Class	Narrow Adapter
B	K86888
C	K85581
D	K85530
E	K85073
F	K85524
G (7 x 12)	K83138
